User flow diagram

So, this is the user flow me and Lizzy worked on, and it really helped us structure our idea better. Basically, a user flow shows all the steps a person would take when using the app — from the moment they open it to the different actions they might take, like signing up, choosing hobbies, or joining events.

The reason we made a user flow before jumping into prototyping is because it gives us a clear picture of the entire experience. We get to see how everything connects, what screens we need, where users might get stuck, and even where errors might happen — like we showed with the school email error.

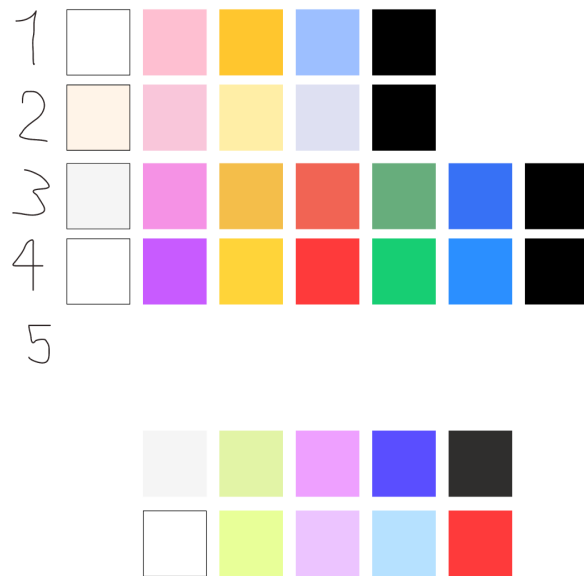

It also helped us think logically about the features. For example, when we added the event section, we realized it wasn't just "make an event" — users also need to add a location, pictures, and maybe even set a max number of people. All of that came from mapping it out in the flow first.

So overall, it's a helpful step for organizing our ideas and making sure the app is usable before we spend time designing or coding anything.

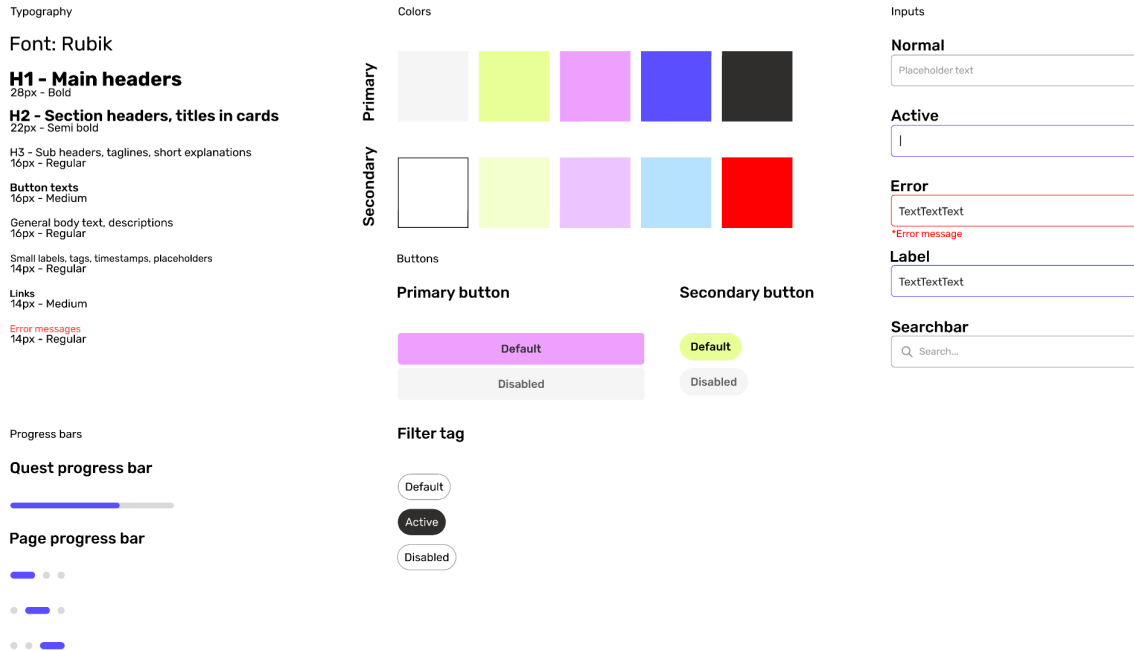

Figma prototype

After we finished the user flow, Lizzy worked on a few different colour palettes. To figure out which one worked best, I tested them with a few people just to get their reactions. Most of them said that the fifth one really stood out the most — they described it as more energetic and friendly, which is the kind of vibe we wanted for the app.

Once we chose that palette, we moved on to creating the UI sheet. That's where we started putting together all the design elements like fonts, sizes, button styles, and things like that. Having this UI sheet is helping us a lot, because it keeps everything consistent throughout the app. So, no matter what screen we're working on, we can make sure the design feels the same — same colors, same style, same tone. It's made the whole process feel more organized and professional, and it's easier to prototype now because we're not making design decisions from scratch each time.

After that I started off thinking for different ways of making the pages, I was assigned to do everything connected with the event page, the home page, discount page and quest page. I was looking at Pinterest and dribbble for most recent designs and what people use most. I had for most of the pages several options and listed pros and cons for each of them so at the end I choose the one that the target audience chose.
